2.REQUIREMENT ANALYSIS:

Requirement Analysis is the phase where the needs and functionalities required for the system are identified and analyzed. In this project, the main goal is to automate the process of importing employee data into the ServiceNow platform and improve the incident management process.

The system should support importing employee details from an external file and automatically display relevant employee information in the incident form. The requirements of the automatic employee data are categorized as follows.

Functional Requirements:

- Functional requirements describe the operations that the system should perform.
- The system should allow importing employee data from external files such as Excel or CSV.
- The system should store employee information in the User (sys_user) table.
- The system should map fields from the import table to the target table using Transform Map.
- The system should automatically display related employee information in the incident form using Dot Walking.
- The system should allow modification of the default priority value in the incident table using Dictionary Override.

Employee Data Fields:

The employee data file should contain the following fields:

- Name – Name of the employee
- Email – Official email address of the employee
- Department – Department in which the employee works
- Manager – Name of the employee's manager
- Manager Email – Email address of the department manager

These fields help identify employees and provide necessary information during incident assignment.

Software Requirements:

The following software and tools are required to complete the project:

- ServiceNow Platform – To implement the project and manage incidents
- Google Sheets or Microsoft Excel – To create and store employee data records
- Web Browser – To access the ServiceNow instance

System Requirements:

The system should support the following capabilities:

- Import employee data using Import Sets
- Map and transfer data using Transform Maps
- Retrieve related information using Dot Walking
- Modify default field values using Dictionary Override
